

Material Containment Systems

Before

After

How did an investment with Richwood save a company \$19K each month?

In this potash facility, the area pictured was being cleaned with a water truck and employees in excess of 40 hours each week. A Richwood consultant recommended a new material containment system comprised of canoe liners, skirting with skirt clamps, impact saddles, cushion arc rollers and edge seal bar stands.

Cleaning time has been reduced to an average of 1-2 hours per month since the Richwood solution was applied.

The only reason any cleaning is necessary at all is due to fugitive dust that arrives out of the unsealed delivery system above.

The after photos were taken 10 days after the installation.
